

Let your portion cutter batch to fixed weight trays

ScanPortioner B55 Cut n' Batch principle and packing table

The portion cutter controls the entire line by first scanning the product and determining where the cuts are to be made to produce the batches for the fixed-weight trays. A pre-defined weight and number of cuts will make up each tray. When the portions (e.g. 2 per 250 g) leave the portion cutter they are separated by a small gap that indicates the fixed weight batches. The fixed weight batches continues onto a packing table for tray packing.

Benefits :

- Provides consecutive pieces with equal color and width in each batch/tray/pack.
- Exact weight on the entire batch (not per piece)
- No need for weighing machines and grader/batcher
- Provides a more gentle handling than a grader/batcher solution
- Higher capacity than an individual weighing line

1. ScanPortioner B55 with Cut n' Batch software
2. Infeed from portion cutter
3. Collection of default and trim pieces
4. ScanWi 411 Scale (3 kg)
5. Take away conveyor
